

Spraying Visualization Options

There are currently two options for job visualization on the running screen:

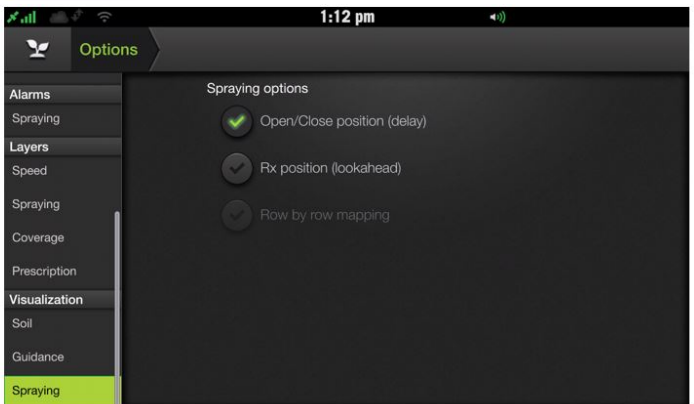

- Open/Close position delay
- Rx position lookahead

If Rx position lookahead is selected visualization on the running screen for Rx maps changing rates.

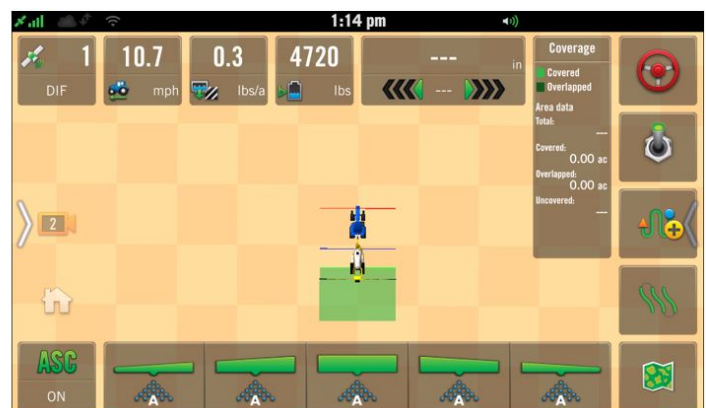

Check this option if user wants to see the delays where the valve on / off time set to.

The Rx lookahead is also speed dependent as per the red line.

Both options selected running at 10.7 Mph.

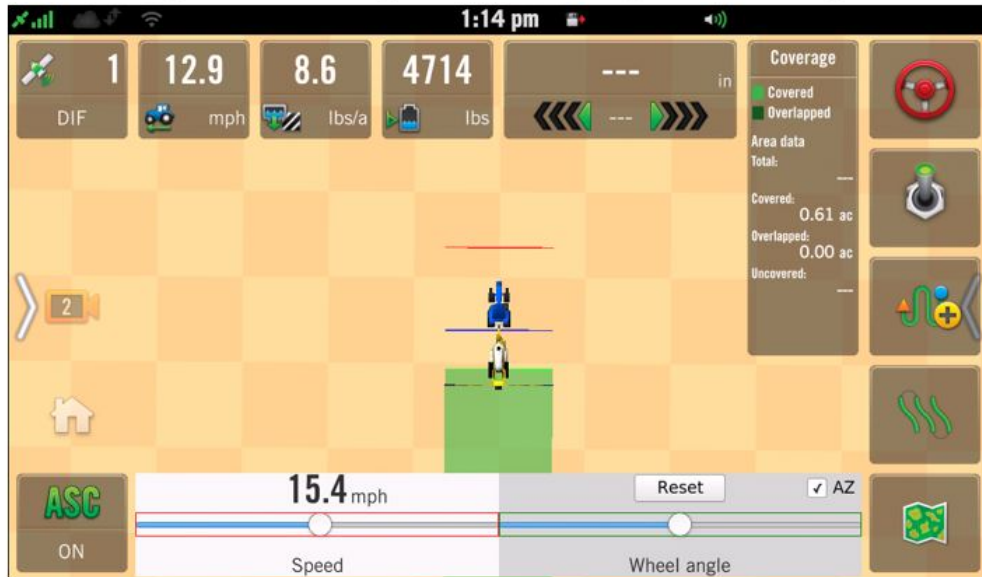

This option shall also be speed dependent – moves as vehicle increases / decreases speed.

These are reflected by the blue and yellow lines on the running screen.

Running 15.4 Mph running both options.

Running just open / close delay.
