# How to Perform a Terminal/ECU Default

The following reasons are why a default should be done on your termianl or ECU.

1) You start your terminal and a default vehicle and/or implement is constantly brought up instead of the current vehicle and/or implement you have already created. (This happens the most on the STX.)

2) If your vehicle or implement settings keep getting lost.

3) If your calibrations are not saved or you re-calibrate and the information doesn't hold.

Use the following instrutions on how to accomplish a terminal/ECU default

1) Press **Menu -> Diagnostics -> GPS -> Subscriptions**
2) Press **Enter Code**
3) Enter **7378423** and touch **Done**
4) The Service Page is now available and either **ECU** or **Terminal Default** can be selected

The terminal and/or ECU will need to be rebooted after a default reset.
See below for all actions required after rebooting your terminal or ECU.

Terminal Default- A new vehicle and/or implement profile will need to be made and a calibration completed.

eDriveXD Default- No actions other than the ECU reboot are needed.

eDriveXC Default- Re-calibration will be required after the ECU reboot.
