

How to set Maverix SBAS PRN

If you set Maverix GPS settings to SBAS, Maverix defaults the PRN's to Auto that will automatically select the best SBAS signal available.

However, if you want to change the PRN's on the A631 paired with the Maverix terminal, you can take the A631 and pair it with a Rebel terminal and set the PRN's that you desire. Once you have changed the PRN's in the A631, you can disconnect from Rebel and re-connect with Maverix. The PRN's will hold and be saved in the A631 and the A631 will be set to those PRN's while paired with Maverix.
